WWTF Project MA07-030

Elucidating spatio-temporal coherence of cellular processes by data-driven inverse analysis: redox rhythmicity in yeast and diffusion controlled hormone feedback cycles

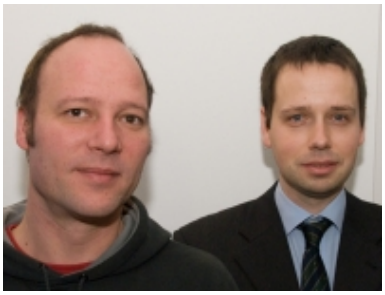
Zusammenfassung

Perhaps the major goal in systems biology is the elucidation of cellular processes. Its pursuit requires the joint efforts of computational, applied mathematicians, experimental biologists and engineers. Advanced mathematical techniques from the fields of nonlinear, inverse and ill-posed problems, are necessary for extracting the desired information about complex cellu-lar processes from the ever increasing datasets avaliable. In this project we plan to develop data-driven inverse methods then apply these to analyse redox phenomena in yeast respira-tory oscillation, diffusion controlled cortisol feedback cycles and circadian regulation of cyanobacterial photosynthesis.

Keywords:

Systems biology, experimental high throughput data, nonlinearill-posed and inverse problems, regularization methods, inversebifurcation analysis, parameter identification, respiratory oscillations ofyeast, large scale ODEs, hormone regulation, react

Principal Investigator:	Philipp Kügler
Institution:	RICAM and Johannes Kepler University
ProjektpartnerInnen:	Christoph Flamm (University of Vienna) (Co-Principal Investigator)



Status: Abgeschlossen (01.03.2008 - 31.08.2010) 30 Monate

Fördersumme: EUR 434.800
